To the Editor—Measles outbreaks have been reported in the Hong Kong Medical Journal in the past 2 years.\textsuperscript{1,2} Such outbreaks occur worldwide, including in countries where measles was previously considered eliminated. In March 2019, there was a measles outbreak at Hong Kong International Airport involving airport workers, some with documented evidence of at least two doses of measles vaccinations.\textsuperscript{3} Fortunately, the patients were all relatively young adults who experienced mild symptoms, and the basic reproduction number of these cases was not high. In response to this outbreak, control measures at the airport included a vaccination programme and measles antibody testing for airport staff. The Hong Kong childhood immunisation schedule was also revised, so that the second dose of the MMRV (measles, mumps, rubella and varicella) vaccination is given at age 18 months (previously given at age 6 years) to enhance protection against measles.

Measles vaccination uptake rate is declining due to pockets of unvaccinated communities and anti-vaccination movements, both of which might have contributed to the recent outbreaks. To eliminate measles, a continuously high (>95%) level of vaccination coverage is required in all areas. Most recent outbreaks of measles in developed countries have been imported cases; thus, they are closely linked to the aviation industry. Early recognition of disease outbreak could prevent a global pandemic. Therefore, it is crucial to have contingency plans at every airport to prevent the spreading of contagious diseases. Travellers should ensure their vaccination status is up-to-date with two doses of measles vaccination; infants from 6 months of age should receive a supplementary dose of measles vaccine if they are travelling to areas with measles outbreaks.\textsuperscript{4} Affected patients, especially school-age children, should be isolated and quarantined at home for at least 4 days from the appearance of rash.

The 2019 measles outbreak saw a substantial increase in the number of measles cases reported worldwide relative to 2018. Such outbreaks will occur again if we do not learn from the past. The only hope to truly defeat measles is for humankind to work together.

To the Editor—Taking a multidisciplinary team approach to better healthcare outcomes for society

To the Editor—Globally, healthcare has become more diverse and complex. A broad range of increasing and emerging challenges are facing people and communities in an unprecedented manner, including population ageing, health inequality, social sustainability, long-term conditions, and coronavirus disease 2019. This calls for an integrated provision of prevention, treatment, and care that extends
Letters to the Editor

Chronic disease management. It is essential to have unconditional and most are dedicated to vulnerable Hong Kong society. These community services are activities and outstanding achievements of medical students serve as interviewers to report various may lead to coproduction of health, giving the most community participation in these services as this realms of clinical encounters and medical practices. Meanwhile, community services play a role in reaching messages to encourage our colleagues and of these exemplary teams would convey far-from a multidisciplinary perspective. The stories of these exemplary teams would convey far-reaching messages to encourage our colleagues and students who are the next generation of healthcare professionals to dedicate themselves to healthcare community. The collections of informative showcases shall substantially contribute to novel models of care delivery to improve population wellbeing beyond the realms of clinical encounters and medical practices. Meanwhile, community services play a role in medical education. Student interviewers could greatly benefit from learning how professionals from varying disciplines work cohesively, communicate efficiently, and share resources cooperatively across sectors and disciplines under strengthened leadership to improve population health outcomes and achieve excellence in healthcare for the community at large.
